

Find $C(t) = 5 \times (0.5)^t$ $t = ?$ $C(t) = 3.5$ mg/g $C(0) = 10 \text{ mg/L}$ $C(9) = 3 \text{ mg/L}$

Given $\frac{5 \times 10^{-3}}{1 \text{ L}} \times \frac{20}{100} \} \% = 3.5 \text{ mg/g}$

$$3.5 = 5 \times (0.5)^t$$

$$0.7 = (0.5)^t$$

$$\log 0.7 = \log 0.5^t$$

$$-0.15 = t(-0.3)$$

$$\frac{-0.15}{-0.3} = t$$

$$0.5 = t$$

$C(t) = C_0 e^{-rt}$
 $C_0 = 10 \text{ mg/L}$ $C(9) = 3 \text{ mg/L}$
 $t = 9$ $r = ?$

$$C(t) = 10 \cdot e^{-rt} = 3$$

$$e^{-9r} = \frac{3}{10}$$

$$-9r = \ln\left(\frac{3}{10}\right) \Rightarrow r = -\frac{\ln\left(\frac{3}{10}\right)}{9}$$

≈ 0.052 ?? per hour.

$r = 0.041$ per hour

$C_0 = 9 \text{ mg/L}$
 $t = 7 \text{ hour}$

$$C(t) = 9 \cdot e^{-0.041 \cdot t}$$

$$C(7) \approx 9 \cdot 0.759$$

$$C(7) \approx 6.759$$

$\therefore$ at 7 hour the amount is 6.759 mg/L
